

Zirconium Oxide Polishers

KOMET® ZR-Polishers™ have been developed to impart a high shine when used for final polishing of restorations fabricated of zirconium oxide and other high-strength materials, including aluminum oxide and pressed ceramics. ZR-Polishers™ incorporate interspersed diamonds for consistently reliable high performance. The two-step polishers are identified by blue for pre-polishing and light gray for high-shine final polishing, each available in three shapes. In addition, their golden shanks readily distinguish KOMET® ZR-Polishers™ from other polishers.

“With a predominantly CAD/CAM-based laboratory, I find the KOMET® ZR-Polishers™ are my first-choice tools for final adjustments and finishing of high-strength ceramic restorations.”
