

Lab Cutters

Feel the impact

SGFA

For work on plaster

Developed for use on wet plaster, KOMET® SGFA cutters provide outstanding material reduction without clogging, efficiently produce smooth surfaces, and perform with minimal operator fatigue.

Safety toothing with a twist to the left ensures that the cutter is securely retained in the chuck, even if the cutter becomes slightly worn or clogged.

Advantages:

- Efficiently reduces material without clogging
- Produces perfect surfaces
- Operates with minimal vibration, thanks to the beveled blades
- Offers secure retention of cutter in chuck due to left-twist, safety toothing

Cutters with NE Toothing

For non-precious metals & alloys

With uniquely engineered blade configurations, these carbide cutters are specially suited for work on hard, non-precious metals and alloys. Cutters with NE toothing produce fast results with minimal effort when used to remove large sprues and to finish base-metal crowns and cast-metal frameworks. NE toothing also provides excellent results when used to finish titanium abutments and copings.

S-Cutters™

Universal Lab Cutters

KOMET® S-Cutters™ have been developed as an economical solution for work on precious metals, non-precious alloys, acrylics, and plaster in the dental lab. They are available in 20 different head configurations to meet the needs and challenges encountered in day-to-day and more demanding lab cases.

Advantages:

- High number of blades ensures durability and accuracy over a long-service life
- Features universal toothing with universal blades
- Staggered tooth configuration enhances operator comfort and work position
- Work on metals produces short, granular metal chips that cannot penetrate skin, thanks to blade and tooth configurations

023 retail: \$23.95

Larger than 023 retail: \$25.95

Fine S-Cutters™

Fine S-Cutters™ from KOMET USA feature fine, staggered toothing and are particularly suitable for finishing alloys, acrylics, and plaster.

Advantages:

- High number of blades allows super-precise finishing
- Smooth surfaces reduce time needed for additional polishing
- Minimal operator pressure needed for smooth, efficient cutting
- Work on metals produces short, granular metal chips that cannot penetrate skin, thanks to blade and tooth configurations

"I think, quite frankly, KOMET® actually has more durable laboratory burs that stay sharper for a longer time. They save you time and money in the long run. These burs are the best available today."

Jack Danilov GMDT, Danilov Dental Laboratory, Carmichael, CA
